Two nights: (€160 ≈ \$220)

Our Research

- Collaboration with 5 small independent hotels in the Netherlands
- Research motivated by real hotel data

Group Bookings

Observation

Large part (41%) of all bookings are group bookings

Networks/Multiple Night Stays

Observation

Big part (29%) stays more than one night

Cancellations

Observations

- 22% of all bookings are cancelled
- Early booking \Rightarrow high cancellation probability

Observations from the Data

- Group bookings (41%)
- Networks (multiple night stays) (29%)
- **Cancellations** (22%)

Customer Choice Cancellation Model

Properties:

- Customer choice behaviour
- Cancellations
- Overbooking

Related work:

- Subramanian et alii (1999): Cancellations
- Talluri and Van Ryzin (2004): Customer choice behaviour
- Newman et alii (2010): Parameter estimation

Other Application Areas

Applying the Cancellation Model in Practice

- Modelling cancellations and customer choice behaviour
- Tractable and well-performing solution methods
- Efficient parameter estimation method

Example (Talluri & van Ryzin, 2004)

Hotel with

- $C = 20$ rooms
- $n = 3$ products with prices

$$r_1 = 160$$

$$r_2 = 100$$

$$r_3 = 90$$

- T days before arrival
- $\lambda = 1/4$ probability that a customer arrives
- x_j number of reservations for product j ($x = (x_1, x_2, x_3)$)
- $\gamma(x_j) = x_j/100$ probability that product j is cancelled
- $c_j = r_j$ costs if product j is cancelled

Example (continued)

- $P(S, j)$ probability that customer buys product j if $S \subset \{1, 2, 3\}$ is offered
- $P(S, 0)$ probability that customer buys nothing
- E.g. $S = \{1, 2\}$ and

$$P(S, 1) = 0.1$$

$$P(S, 2) = 0.6$$

$$P(S, 3) = 0$$

$$P(S, 0) = 0.3$$

Objective

Which rooms in combination with price and conditions to offer?

Solution

Model as Markov decision process and solve with dynamic programming:

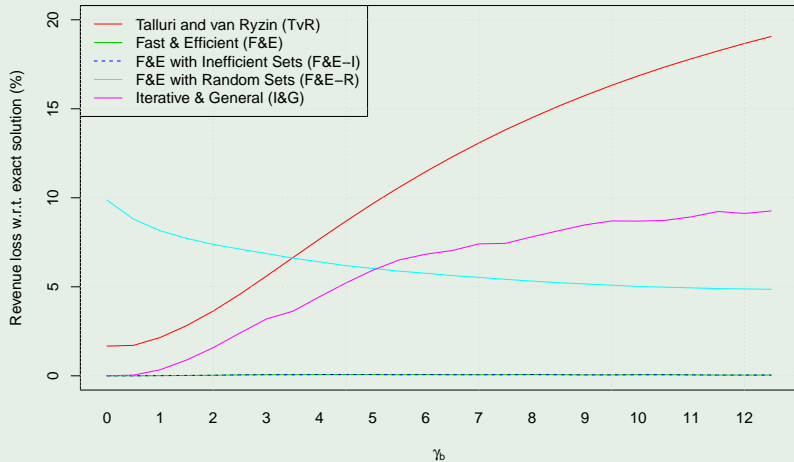

$$\begin{aligned} V(x, t) = \max_{S \subseteq N} & \left\{ \lambda \sum_{j \in S} P(S, j) (r_j + V(x + e_j, t - 1)) \right. \\ & + \sum_{j=1}^n \gamma_j(x) (-c_j(t) + V(x - e_j, t - 1)) \\ & \left. + \left(1 - \lambda \sum_{j \in S} P(S, j) - \sum_{j=1}^n \gamma_j(x) \right) V(x, t - 1) \right\}. \end{aligned}$$

Properties

- Reduced state space under equal and linear cancellations assumption $\gamma_j(x) = \gamma x_j$
- Heuristic performs well under this assumption

Performance of Solution Methods under Different Cancellation Probabilities

Estimating Parameters

Maximum Likelihood Function:

$$L(\lambda, \gamma, \beta | x, Z, S, j) = \prod_{t \in D} [\lambda P_{tj(t)}(\beta, Z_t, S_t)]^{a_\lambda(t)} \\ \times \prod_{j=1}^n \gamma_j(x_j)^{a_j(t)} \cdot \left[1 - \lambda - \sum_{j=1}^n \gamma_j(x_j) \right]^{a(t)}$$

New Parameter Estimation Algorithm

Based on Newman et alii (2010).

- 1 Estimate $\hat{\gamma}$ (cancellations)
- 2 Estimate $\hat{\beta}$ (customer choice behaviour)
- 3 Estimate $\hat{\alpha}$ and $\hat{\lambda}$ using $\hat{\beta}$ (market demand)

Upside: Fast; accurate; consistent

Downside: Data collection difficult for independent hotels

Example: customer choice behaviour estimate

	Family	Double	Twin	Single	Price	Competition
β	9.43	0.36	-0.38	-10.43	-0.57	1.32

Observations:

- Price elasticity: higher price \implies lower demand
- Competition price higher \implies higher demand
- Family room attractive, compensated by price.
- Single room less attractive, compensated by lower price.

Current Research: Applying the Cancellation Model

- Pilot starting soon in several Dutch hotels
- Hotels currently do not use RM system

Collaborating hotels

Conclusion

- Cancellations have big impact on revenue
- The heuristic approximates the optimal solution well
- The new parameter estimation method performs well
- Cancellation model is suitable for practitioners

Further Research

- Application to Dutch hotels
- Expand with group bookings and networks/multiple night stays
